I've tried to hook into the global exception handler and show the users an message box, that is working. But in this case the exception is swallowed, that is, my application ends. The code looks as follows: static void Main() { try { Application.Run(new Form1()); } catch (Exception ex) { MessageBox.Show(ex.Message); } } I would like to catch the exception and determine the cause. Is that even possible? I've searched the net for solutions but I haven't found any that worked for me. Best regards, A: You could use a try..catch to log the exception, it will still allow you to run your program in the catch, but will at least output the exception. static void Main() { try { Application.Run(new Form1());

You don't have to hit the "keypad" of your keyboard to enter a special command. This technique saves you from the extra stress of pushing many keys all at once and save your fingers a lot of fatigue. You just have to hit one specific key and move your mouse over the destination, for example, a button on your mouse. The button will then be highlighted. Release the "click" and the command will be performed. To repeat the process, simply hit the button again and press the "click" again, and so on. In this guide we will introduce you to a keyboard shortcut that will take the hard work off your hands. We are sure you'll like it. Keyboard shortcuts are a lot faster than memorizing special key combinations, and you will be able to use them from the very first day you'll need to use them. Just like we have to learn our alphabet, it is normal to learn how to perform certain tasks with our keyboard. There are many ways to perform an action with your keyboard, but there are also some you will need to become acquainted with. The most important part in performing a task is, of course, to press a specific key, but the second part is to make sure the key is in the right place, or, in other words, in the correct position. You might find the task easier if you find the right position of the keys. It is a process of trial and error, but that's a lot less time consuming than figuring out the key combination from scratch. To memorize a key combination you have to repeat the same process over and over again, which might not be the best way of learning. Instead, you could press your button and move your mouse to the item you want to perform the action on. Then, once the mouse is on top of it, release the "click" and the command will be performed. A mouse with buttons is able to be more sensitive and to perform different actions than a keyboard, but the mouse has to be in front of your computer, which is why you should not use it for anything important. So, how do you use a keyboard shortcut? Here's a short example of an action: Instead of pressing Alt+S to open the Save window, press Alt+S while you are hovering your mouse over the Save button. Once you have mastered the first step, you can easily open other windows and applications by using the same technique. There are several 77a5ca646e
